Why We Wrote This Book

As podiatrists, we specialize in the care and treatment of the feet and ankles. In the last decade, we’ve seen firsthand that the incidence of heel pain in our general population has reached epidemic proportions.

One out of four Americans will experience some form of heel pain in their lives.

Heel pain is experienced by people of all ages and demographic backgrounds. We often see children in our practice who are suffering from heel pain, working people who are on their feet most of the day, and older people who just wake up one morning with sharp stabbing pains in their heels.

There are many reasons why more of us are experiencing heel pain, two of the biggest are our increasingly active lifestyles and the increase of obesity. So many of us are exercising on a regular basis, and while this is a tremendous thing for our health, it can contribute to the experience of heel pain. The good news is that you can continue to work out regularly and effectively treat your heel pain too.

There are a number of causes of heel pain and we will cover them in greater detail later in this book. What we find interesting is that most of the root causes can often be prevented. Sometimes it is a simple matter of wearing the correct shoes, learning how to properly stretch your muscles, and proactively working with a podiatrist to maintain the health of your feet and ankles.

So often, the people that come in to see us do so after the pain becomes unbearable. This is frustrating for us because the fact is you simply do NOT have to suffer. Don’t wait until the pain is so bad that you can’t even walk or function normally. If you come in at the first sign of pain we can almost guarantee that together we can fix whatever the problem is.
After noticing all of this we decided to create a publication for you. We wrote it so that you could understand the causes of heel pain, the treatments available to you, and so that you could learn how to prevent heel pain in the future.

If after reading it you think you might be helped by seeing a podiatrist, we hope you consider Issaquah Foot & Ankle Specialists. We will do everything we can to treat your condition, reduce or eliminate your pain, and make you feel at home.

Dedicated to your health,

Dr. Timothy Young & Dr. Brandon Nelson

What Causes Heel Pain?

Pain is the body’s way of telling us that we may have suffered an injury or contracted an illness. Pain that occurs in our heels alerts us to seek medical attention. Because a variety of causes exist for heel pain, it is very important to have any type of heel pain properly diagnosed by a podiatrist.

The heel bone is the largest of the 26 bones found in the human foot. The foot also has 33 joints and a network of more than 100 tendons, muscles, and ligaments. The heel bone is subject to a variety of outside influences that can affect its ability to function properly. Symptoms of heel pain that should be treated by a podiatrist include pain on the bottom of the heel or the back of the heel, pain that worsens upon rising, and pain that increases in severity over a period of months. The most common causes of heel pain on the bottom of the foot are plantar fasciitis, heel spurs, and tarsal tunnel syndrome. The most common causes of posterior heel pain or pain behind the heel are Achilles Tendonitis, heel bursitis, and heel bumps. We’ll discuss each of these now.

**Plantar Fasciitis**

This is the most common cause of heel pain on the bottom of the foot and is an inflammation in the band of tissue (the plantar fascia) that runs from the heel to the toes. This condition is most often caused by poor foot structure such as
overly at feet or high arches. It can also be caused by wearing non-supportive footwear on hard surfaces, spending long hours on your feet, or obesity. The pain from plantar fasciitis is usually a sharp, stabbing pain on the inside of the bottom of the heel that can feel like a knife sticking into your heel. Pain from plantar fasciitis is usually most severe when you first stand on your feet in the morning. It will usually subside, but can return with prolonged standing or walking or getting up after long periods of sitting.

**Heel Spurs**

Sometimes heels spurs are found in people with plantar fasciitis, but they are rarely the source of pain. Heel spurs are bony growths on the underside of the heel bone caused by tension from a tight ligament, the plantar fascia. They result from strain on the muscles and ligaments of the foot, stretching of the plantar fascia, and repeated tearing away of the lining or membrane that covers the heel bone. Close to 70% of patients with plantar fasciitis have a heel spur that can be seen on an X-ray. Plantar fasciitis and heel spurs are often confused and they are related, but they are not the same condition.

**Tarsal Tunnel Syndrome**
The tarsal tunnel is a tight space in the foot that lies between bones and tough fibrous tissue. A nerve called the posterior tibial nerve lies within the tarsal tunnel. If this nerve becomes compressed or squeezed, tarsal tunnel syndrome can result. Symptoms include numbness over the bottom of the foot and/or pain, burning and tingling over the base of the foot and heel. Tarsal tunnel syndrome is similar to carpal tunnel syndrome, which occurs in the wrist. Both disorders arise from the compression of a nerve in a confined space.

Achilles Tendonitis

The Achilles tendon is named for Achilles, the Greek mythology hero who was vulnerable only at his heel. The Achilles tendon is the largest tendon (a band of tissue that connects muscle to bone) in the human body and is very strong, but is also the tendon we most often injure and rupture. Everyone who is active can suffer from Achilles Tendonitis, a common overuse injury and inflammation of the tendon. Symptoms of Achilles tendonitis include mild pain after exercise or running that gradually worsens, a noticeable sense of sluggishness in your leg, and episodes of diffuse or localized pain, sometimes severe, along the tendon during or a few hours after activity. Symptoms also include tenderness, or sometimes intense pain, when the sides of the tendon are squeezed. Other symptoms can be swelling, morning tenderness in the Achilles tendon, or stiffness that generally diminishes as the tendon warms up with use.

Heel Bursitis

There are several fluid-filled sacs behind the heel bone that act as a cushion and a lubricant between muscles and tendons sliding over bone. They are known as bursa. Repetitive or over use of the ankle can cause the bursa to become inflamed or irritated leading to heel bursitis. The condition is often mistaken for Achilles Tendonitis. Symptoms include pain in the heel, especially when walking, running, or jumping or when the area is touched. The skin around the back of the heel may be red and warm to the touch, and the pain may worsen when standing on tiptoe. It is commonly seen in people who are just starting an aggressive exercise routine.

Heel Pain

Heel Bumps

Also known as Haglund’s Deformity, heel bumps are a bone enlargement on the back of the heel bone. These usually occur for athletes when the shoes they wear rub up
against the heel, and they can be aggravated by the height or stitching of a heel counter of a particular shoe. The result is a painful bump or bumps on the heel that make exercising very difficult. Another term used for this condition is pump bump because it can frequently occur with the wearing of high heels as well.

**Sever’s Disease**

The most frequent source of heel pain in children between the ages of 9 and 15 is Sever’s Disease. It is caused by an inflammation of the growth plates in the back of the heel due to rapid bone growth and is most often seen in children who participate in athletics. With this condition pain is usually felt at the back and side of the heel bone or even the bottom of the heel. Pain usually worsens when the heel bone is squeezed or when the child is running or jumping. Podiatrists are trained to treat patients of all ages and it is important to have your child examined if they are complaining of heel pain or limping.

**What Can A Podiatrist Do About Heel Pain?**

Let’s start at the beginning and answer the question, “What is a Podiatrist?”

A podiatrist is a specialist who focuses on your feet and ankles. We are quite simply “The Experts” on your feet, heels, and ankles and should be the very first doctor you call when you experience pain or other problems with them. In addition to heel pain, we’ve also listed many of the other problems podiatrists treat in this book.

The DPM after our name stands for Doctor of Podiatric Medicine. Most people know that podiatrists deal with foot, heel, and ankle problems and work with seniors, or diabetics, or people with poor circulation; what most people don’t know is that podiatrists treat patients of all ages. A podiatrist is also well-qualified to help children and young adults with the problems that they can experience with their feet, heels, and ankles.

Podiatrists are required, just like any other doctor, to be licensed by the state in which they practice. When medically necessary, podiatrists can perform surgery to correct or remedy problems. Before we recommend surgery, we will explore the many conservative therapies and remedies that are available for our
patients and then recommend the very best course of treatment. As medical science advances and new therapies become available to the public, podiatrists are increasingly able to offer their patients some of the most state-of-the-art care available. We’re constantly amazed at the new therapies we can offer our patients and will discuss several of them now.

**Conservative Heel Care**

Also known as non-surgical treatment, conservative heel care is used to treat most heel problems with dramatic results. Any initial visit to a podiatrist’s office will start with a patient history and physical examination. Diagnostic x-rays, high resolution ultrasound imaging and laboratory tests can also be used to help determine the best course of treatment.

Heel Pain

There are a wide variety of non-surgical treatments being used by podiatrists today. Prescription orthotics, cortisone injections, oral and topical medications, and heel taping or strapping are all examples of conservative heel care. Other options include orthotics, exercise, good walking shoes, and physical therapy.

Non-surgical treatments are called for in most cases including medical conditions which preclude the option of elective surgery, time commitment constraints, and elderly patients with many medical conditions. In spite of not being able to opt for foot surgery many patients find great relief from pain and discomfort through the use of conservative heel care treatments.
Prescription Orthotics

Custom-made heel supports are known as functional biomechanical orthotic devices and are worn under your heel and the arch of your foot. These devices are molded to be anatomically matched to your foot and they do more than just provide support. Prescription orthotics are designed to realign the bones and joints in your feet and heels to a neutral or natural position to alleviate pain in your feet, legs and back, as well as to restore balance, improve sports performance, and relieve foot fatigue.

Research shows that the majority of heel problems can be directly connected to skeletal imbalance. More and more people tend to have some amount of either hyperpronation (at feet) or hypersupination (high arches). The presence of these conditions can cause the heel to be unstable during normal everyday activity. This constant stress on the heel can lead to pain in the feet, ankles, legs, knees, hips, and back. Prescription orthotics can improve function in the heel by compensating for existing imbalances and in most cases can relieve or prevent the associated pains.

How do you know if the use of orthotics is right for you? If you have an obvious imbalance that causes such symptoms as at feet or high arches, or if you have external misalignments such as “knock knees,” “bow knees,” in-toeing, or out-toeing you are probably a good candidate for orthotics. If you participate in an activity that places stress on your feet or if your work requires you to be on your feet for extended periods of time orthotics could be beneficial. The use of orthotics is just one of the conservative foot treatments used in our offices. They can be used to treat foot, heel, and arch pain and to
Heel Pain

prevent sports injuries or improve sports function. Prescription orthotics can be used to treat children as well as adults. The best way to find out if prescription orthotics can help you is to make an appointment with us for an exam.

ESWT

Extracorporeal Shock Wave Therapy treatments use high-power sound waves to end chronic heel pain without painful surgery. This treatment is now being offered by our office as an alternative to heel surgery. The discovery of ESWT came about somewhat by accident. Shock wave therapy is used regularly by urologists to break up and disperse kidney stones. Urologists began reporting that patients who had kidney stones treated showed increased bone density and new tissue growth. This led to studies for using shock wave therapy for soft tissue injuries and the results were amazing—75%-80% of patients with soft tissue injuries were reported to be healed or greatly improved following ESWT.

Shock wave therapy works by purposely targeting trauma at the pain site. This stimulates the diseased tissue and activates your body’s own healing process. Blood and oxygen rush to the site, activating a metabolic response that fosters healing by the growth of new connective tissue. This is what is damaged and torn when you have plantar fasciitis or heel spur pain. The most important and exciting aspects of ESWT are that it ends the pain, the procedure is not painful, there isn’t a lengthy recovery period, and there are no side effects.

Autologous Platelet Concentrate

Autologous Platelet Concentrate is a procedure that is done to stimulate healing. Blood is drawn from the patient, spun in a centrifuge, and the platelets (the growth and healing factors of the blood) are drawn out afterwards. After the platelets are drawn out, high resolution ultrasound imaging is used to guide the procedure and the the platelets are reinjected into the damaged tissue of the plantar fascia. This stimulates healing at a rate of 500% more quickly than the healing rate of normal blood vessels

Foot and Ankle Surgery
In a few cases heel problems do not respond to conservative treatments. A podiatrist can best determine when surgery might be beneficial. In cases when pain or deformity persists surgery may be needed to restore full function.

Prior to surgery a podiatric surgeon will review your medical history and perform an examination. Specific medical tests may be required before undergoing surgery. These tests may include X-rays, blood tests, urinalysis, and blood flow studies to determine the circulatory status of your feet and legs.

The length and method of postoperative care that is needed is determined by the type of surgery performed. All postoperative care includes some degree of rest, ice, compression, and elevation. Other elements can include bandages, splints, surgical shoes, casts, crutches, and canes. Recovery can be quickened by carefully following your podiatrist’s instructions.

12

**How Does a Podiatrist Treat Other Conditions?**

Now that we know what a podiatrist is and some of the treatments available let’s take a look at some other foot problems and the treatments we can offer to reduce or eliminate your pain. It is impossible to discuss all the potential problems that can affect the health of your feet in a book of this size, but what we want to tell you about here are the problems we see most often at our offices.

**Arthritis**

Over 30 million American adults report being told by a doctor that they have some type of arthritis. It is a major cause of lost work time and serious disability for many people. Although arthritis is mainly a disease of adults, children may also have it. When a patient has arthritis, it means that the cartilage and even the lining of their joints has become swollen and inflamed.
There are numerous types of arthritis. The reason that your feet seem to be more susceptible to arthritis than other parts of your body is that your feet have so many joints that can be affected. The odds are just stacked against your feet. In addition, your feet and ankles bear the full weight of your entire body every single day.

While there are dozens of types of arthritis, we want to point out two of the most common.

**Osteoarthritis**

The most common type of arthritis is osteoarthritis. It is seen in many people as they age, although it may begin when they are younger as a result of injury or overuse. It is often more painful in weight bearing joints such as the knee, hip, and spine than in the wrist, elbow, and shoulder joints. All joints may be affected if they are used extensively in work or sports, or if they have been damaged from fractures or other injuries.

The key to treating arthritis in your feet is early detection and proper care from a podiatrist. Be vigilant in checking your feet every day and if you begin to experience stiffness (especially in the morning when you wake up and start walking), swelling, or redness just give us a call and let us check it out for you.

**Heel Pain**

In osteoarthritis, the cartilage covering the ends of the bones gradually wears away. In many cases, bone growths called “spurs” can develop in osteoarthritis joints. The joint inflammation causes pain and swelling. Continued use of the joint produces pain. Some relief may be possible through rest or modified activity.

**Rheumatoid arthritis**

Rheumatoid arthritis is a long-lasting disease that can affect many parts of the body, including the joints. Rheumatoid arthritis can affect people of all ages, even children. However, more than 70 percent of people with this disease are over 30 years old. Many joints of the body may be involved at the same time. Arthritis cannot be cured but it can be treated. The goals of treatment are to provide pain relief, increase motion, and improve strength.
Bunions

Bunions are caused by your big toe joints becoming incorrectly aligned. This causes the first joint on your big toe to slant outward and the second joint then angles toward your other toes. Your joints then begin to swell. It causes a bump of bone on the foot that can become very painful if left untreated.

Bunions can be hereditary, but also can be aggravated by shoes that aren’t a good fit. Surgery is often recommended to correct the problem. Most bunions can be treated without surgery by wearing protective pads to cushion the painful area, and of course, avoiding ill-fitting shoes in the first place.

The Bellevue Bunion Center, a division of Issaquah Foot and Ankle Specialists, is dedicated to bunion treatments. The Bellevue Bunion Center provides the latest treatments using the latest technology to treat bunion deformities. For more information about the Bellevue Bunion Center and the highly effective bunion treatments, both surgical and non-surgical, visit www.BestFootDoc.com

Diabetes

Diabetes can affect many parts of the body, especially the feet and heels. According to the American Diabetes Association, about 15.7 million Americans (5.9 percent of the United States population) have diabetes. It is very important that a diabetic gives the feet very special care. A small problem in a healthy person could become a severe one to a diabetic.
Heel Pain

Diabetes can affect the feet in a number of different ways. The first is infection, which is one of the most common complications of the diabetic foot. Because diabetes causes a reduced immune response, a diabetic patient’s ability to fight infection is decreased. Early treatment of infection is a critical component to success. If neglected, infection of the foot can cause gangrene, ulceration, osteomyelitis, and even amputation.

Another complication of diabetes called neuropathy causes decreased sensation to pain and temperature. This may cause a patient to underestimate a foot problem. It may also be responsible for an absence of perspiration leading to dry, cracking skin that can more easily become infected.

With a diabetic foot, a wound as small as a blister from wearing a shoe that is too tight can cause a lot of damage. Diabetes decreases blood flow, so injuries are slow to heal. When your wound is not healing, it’s at risk for infection. As a diabetic, your infections spread quickly. If you have diabetes, you should inspect your feet every day. Look for puncture wounds, bruises, pressure areas, redness, warmth, blisters, ulcers, scratches, and cuts. Get someone to help you, or use a mirror. Diabetic foot care can be very complicated and good podiatric care is an essential component of managing diabetes.

Here is some basic advice for the care of diabetic heels:

- Inspect your feet every day.

- Keep your feet clean and dry.

- Always keep your feet warm.

- Take extra care drying your feet and toes after showering. Pay special attention to the space between your toes.
• Be sure to exercise. Walking is one of the best exercises for diabetes unless you have complication. If you struggle with balance use a cane.

• Always protect your feet and legs. Never walk barefoot. Avoid hot water bottles and heating pads.

• Do not overexpose skin to the sun.

• Never use razor blades, knives, scissors, or medicated corn/wart removers.

• Look for redness, blisters, scratches, cracks between the toes, discoloration or any other change.

• Avoid all actions that diminish circulation such as tobacco use, sitting with legs crossed, and circular elastic garters.

• Change your shoes and socks daily.

15

Heel Pain

• Wear soft leather shoes that conform to the shape of your overall foot.

• Gradually “break in” new shoes and avoid blisters. Call us immediately if you see any changes in your feet.
**Fungal Nails**

Fungal infections of the nail bed, matrix, or nail plate are responsible for about 50% of all cases of thick, discolored toenails. There are four different types of fungal nail infections classified by the part of the nail involved. Fungal nails can be caused by tight footwear, minor trauma caused by exercise, communal showers, and diseases that influence the immune system.

Treatment for fungal nails varies by the nature of the infection and the severity. A podiatrist can detect a fungal infection early and formulate a suitable treatment plan. This can include topical or oral medication, debridement, and in extreme cases, surgery. Trying to solve any nail infection without the help of a podiatrist can lead to more problems.

**Hammertoe**

A hammertoe is a flexible or rigid contraction usually affecting the second, third, fourth, or fifth toe. In this condition, the toe is bent at the middle joint, resembling a hammer. Muscle imbalance leads to a bending or “buckling” of the toe joints. These buckled or contracted positions create any number of problems within and on top of the toe deformity. It is important to treat hammertoes early. As they advance and lose flexibility the only option for correction may be surgery. Hammertoes can cause complications such as corns or calluses at the point where they come into contact with the shoes. As with many foot problems one of the causes of hammertoes can be improperly fitted shoes. Podiatrists have a variety of ways to treat hammertoes, including surgery, orthotics, better shoes designed with extra room for toes, corn pads, straps, and cushions.

**Metatarsalgia**
Metatarsalgia is foot pain in the ball of your foot which is the area between your arch and your toes. It gets its name because the pain experienced is located in the metatarsals located in this part of the foot.

Heel Pain

In this condition one or more of the metatarsal joints becomes inflamed and painful because of synovitis or capsulitis. People often develop a callus under the affected joint. There are many causes of Metatarsalgia including injuries, arthritis, poorly fitting shoes, and working on very hard surfaces. Sometimes changing your shoes will x the problem. We may also recommend orthotics or implants.

Morton’s Neuroma

This condition is a thickening or enlargement of the nerve tissue in the ball of the foot. Neuromas often form when the nerve is irritated or compressed. Sometimes runners and joggers develop them because of the repeated pressure that occurs when feet hit the pavement. Most neuromas begin gradually, and you may be able to eliminate the pain temporarily by massaging your foot, changing footwear or a rest from running. Unfortunately, neuromas tend to worsen over time as the temporary changes in the nerve become permanent. Treatment options generally include orthotics, changes in footwear, oral medications, surgery, and injection therapies such as cortisone or alcohol.

Sprains

An ankle sprain occurs by stretching or tearing one or more ligaments on either or both sides of the ankle. Ignoring a sprain won’t help it heal any faster. Ankle injuries that are serious enough to cause disabling pain should be treated by a
podiatrist. Further examination may even reveal a torn ligament or bone fracture. Common treatments for sprains include rest, elevation, compression, and ice. More serious sprains may call for crutches or other walking devices.

**Stress Fractures**

An incomplete break in the bone caused by overuse is known as a stress fracture. Symptoms can include pain, swelling, and redness. Up to 15% of all sports injuries are stress fractures. A podiatrist needs to perform an examination and look at X-rays of the injury in order to diagnose a stress fracture. Treatments include immobilization of the foot with the use of a cast, medications and in some cases orthotic devices to prevent further injury.

**Warts**

Warts are caused by a virus that generally enters the body through small nicks or abrasions in the skin. When they occur on the soles of the feet they are known as plantar warts. Due to the amount of pressure that is put on the feet in the course of a day, plantar warts can become quite painful. Teenagers between the ages of 12—16 are most commonly infected by warts but they can occur at any age. Warts are often contracted by walking barefoot on dirty surfaces or ground. The virus thrives in warm, moist environments like showers and swimming pools.

If you suspect that you or a family member has a plantar wart, see a podiatrist to get a correct diagnosis and treatment plan. Treatments may include the use of a wart-removal preparation or CO2 laser cautery performed under local anesthesia to safely remove the wart. Many patients are referred to our clinic, Issaquah Foot & Ankle Specialists, because of our ability to effectively treat difficult and persistent warts.

**Wounds and Ulcers**
Foot ulcerations or open wounds are a condition where there is a breakdown in many layers of skin and tissue sometimes going all the way to the bone. They can be caused by pressure to a weight bearing point on the foot, but they can occur on top of the foot or due to pressure from shoes or a bony spur. The risk of ulcer formation is higher in patients with decreased circulation or impaired blood supply to the legs and feet. Diabetics are prone to heel ulcerations, but they can be found in patients with high blood pressure, blood clots, varicose veins, and phlebitis as well.

Treatment for foot ulcerations varies according to the cause of the wound. The goal of the treatment is to close the wound from the inside out as quickly as possible. In cases where there is adequate circulation, debridement (removal of dead tissue) may be used around the edges and within the ulcer itself to promote healing. Other treatments include oral medications, compression, and bed rest. New advances have been made in wound care in recent years including the use of a platelet-derived growth factor as a way to promote healing.

What Can You Do About Heel Pain?

The first step in dealing with heel pain is to care for your feet. Your feet are the hardest working part of your body. They carry you wherever you need to go. In fact, during your lifetime you will have traveled on your feet the equivalent of three trips around the entire world. You take on average 15,000 steps a day and will walk or run over 75,000 miles in your lifetime. Caring for your precious feet and ankles is the best step to avoid heel pain and is a critical component in eliminating it as well.

Here are some steps you can take to keep your feet and ankles health and functioning:

First and foremost- do not ignore feet and ankles. Healthy feet do not have persistent pain or skin that looks unusual. If your pain does not subside quickly, please contact our of office right away. The sooner we can see you and examine your feet, the quicker we can begin to make the corrections needed to get your feet healthy again. So often we see people who have waited a very long time and suffered needlessly.
Try to develop a habit of always checking your feet. A great time to do this is right after a shower or during a bath. If you start a habit of carefully drying your feet after bathing (pay special attention to the skin between your toes) you can quickly check your feet to see if you notice any changes. If you see nails that look unusual you might be seeing a potential fungus developing. If your skin is broken, cracked, or has an unusual color, you are noticing abnormalities. Finally, if your foot is changing shape or you observe new growth, you should make an appointment to see us so we can treat these conditions before they progress and become worse.

If you have diabetes it is especially important to check your feet regularly and often. In fact, we recommend that you have someone else help you check your feet, because you may not be able to see or most importantly, feel problems. Early detection and treatment may avoid potentially serious complications later.

Heel Pain

See a podiatrist if you have a problem with your feet. Treating yourself can often cause problems or exacerbate existing problems. If you are a diabetic you are at greater risk for foot problems so be sure to make an appointment to see us at least once a year. We would love to see you! We are here to help!

The latest information about heel pain treatments is available at www.SeattleHeelPain.com and www.BestFootDoc.com which also includes more information about the other conditions listed in this book.

When To Call a Podiatrist

Podiatrists are the experts on feet and ankles and should be the first doctor you call when you experience any of the symptoms or pains described in this book.

Podiatrists treat foot and ankle problems for patients of all ages. You should call a podiatrist when you have pain in your feet and ankles. If you notice that there is any change at all to your nails or the skin on your feet and ankles, you should see the expert on your feet.

If you have diabetes or poor circulation and you develop any abnormal symptoms you should see us immediately. You are at a much greater risk for serious complications. And if you have diabetes you should see us at least once a year whether or not you
have symptoms or pain. Regular check-ups are a great way to help keep your feet and ankles healthy.

Most importantly, you should call us first when you have pain or any issue that affects your feet and ankles.

What To Do If You Are In Severe Pain

Pain is our body’s way of telling us that something is wrong. It is usually true that the more severe the pain, the more serious the problem. If you are experiencing severe foot pain, seek treatment from a podiatrist immediately. Podiatrists specialize in dealing with foot and ankle problems and are experts in helping treat your symptoms. You can reach our office at:

Issaquah Foot & Ankle Specialists

450 NW Gilman Blvd., Suite 303 Issaquah, WA 98027

Tel: 425-391-8666

If you are experiencing an emergency, call 911.

Final Thoughts

We hope the information in this publication has been helpful. Our purpose in sharing it with you is to give you the information you need to take the appropriate actions to care for your feet. We hope it helps you understand the pain you or your loved one may be experiencing. We also wrote it to help you see that podiatric medicine has benefited greatly from the advances medical science is making in the treatment of heel and overall foot conditions.

We know that making an appointment to see a doctor is not always the easiest thing to do. However, we offer many treatments that can greatly improve the quality of your life. You do not have to live with heel pain. In fact, many patients usually have immediate relief after their first visit. Contact our of
office today or visit our website, www.BestFootDoc.com, to request an appointment, you will be glad you did.

Dedicated to Your Health,

*Dr. Timothy Young & Dr. Brandon Nelson*

**Free Copy of Heel Pain**

If you have any friends or family members who might benefit from the information provided in this book, we would be happy to provide them with their own copy free of charge. Just tell them to visit our website at [www.BestFootDoc.com](http://www.BestFootDoc.com) to request it online. Please Note: The printed version of our Heel Pain book is reserved for Washington residents. For friends and family that wish to receive a copy of this book outside of Washington state will be sent an electronic version of this book.
About Us

Dr. Timothy W. Young
Doctor of Podiatric Medicine
Issaquah Foot & Ankle Specialists  450 N.W. Gilman Blvd. Suite 303 Issaquah, WA 98027
425-880-9552

Dr. Timothy Young, a native of the Puget Sound area, has lived near Issaquah since 1964 and attended Issaquah schools before going on to the University of Washington. He received his DPM degree at the California College of Podiatric Medicine, and continued on with his foot surgical training and residency training at New Berlin Memorial Hospital in Wisconsin. Having returned to Issaquah to open his clinic in 1986, Dr. Young lives in the local area with his wife Kari and their three children. When not practicing medicine, Dr. Young enjoys spending time with his family and activities which include snowboarding, boating, wakeboarding and fishing. He keeps fit by jogging, mountain biking, hiking and walking.

Brandon Nelson, DPM
Issaquah Foot & Ankle Specialists  450 N.W. Gilman Blvd. Suite 303 Issaquah WA 98027-2483
425-391-8666

Dr. Brandon Nelson was born and raised in the Northwest and attended school in Edmonds before graduating from the University of Washington. He received his Doctor of Podiatric Medicine at Des Moines University and completed his three year residency training at Tacoma General Hospital in functional reconstruction of the foot and ankle. He lives in the local area with his wife and two children. When not practicing medicine, Dr. Nelson enjoys traveling with his family, fishing and snowboarding.
